

Software Installation and Tutorials

BME554L (Spring 2026)

2026-01-05

Table of contents

Git (Version Control)	1
Visual Studio Code (IDE)	1
State Diagram Software	2
Zephyr SDK / nRF Connect / Nordic Dev Academy	2
Hardware to Buy	3
Technical Reports: Jupyter Notebooks	3
What to Submit	4

Git (Version Control)

Please follow the instructions on this dedicated [git page](#) to:

- Install `git`
- Configure `git`
- Setup an SSH key
- Provide links to `git` tutorials to remind you how to use `git` version control

Visual Studio Code (IDE)

We will be using [Visual Studio Code](#) as the IDE for all projects in this class. In addition to installing the base program, please install the following Extensions:

- nRF Connect for VS Code (Extension Pack)
- GitLens (help with `git` operations / visualization)

- C/C++ (not the extension pack, since it include **CMake Tools** that has some incompatibilities with the Zephyr build tools)
- Cmake
- State diagram software (see below)
- [GitHub CoPilot Chat](#) AI coding assistant (optional, but highly recommended)

Tip

You can get “Pro” status for GitHub CoPilot by signing up for a free [GitHub Education Student](#) account. You will need a document to verify your student status that includes your dates of enrollment, which your DukeCard does not contain. Instead, you can get an Enrollment Verification document through DukeHub (Academics Tab) and convert the downloaded PDF to a JPG or PNG file to upload to GitHub.

State Diagram Software

We will be generating state diagrams all semester, which can be done with a variety of different software packages, described [here](#). Please be sure to have one of the described software packages ready for you to prepare state diagrams this semester.

Zephyr SDK / nRF Connect / Nordic Dev Academy

- Sign up for an account on the [Nordic Semiconductor DevAcademy](#)
- Please complete the following tutorial to get your environment setup for using the Nordic nRF Connect SDK: [Lesson 1 - nRF Connect SDK Introduction](#)

This will run you through the process of:

- Installing the [nRF Connect for VS Code](#) extension pack.
- Installing all of the associated **nRF Connect** tools for your laptop, including the **nRF Connect SDK** and associated **toolchain**.

Tip

Be sure to use the **nRF Connect SDK v3.2.1** for this class. The starter code provided throughout the semester will be based on this version of the SDK.

- Once you have the hardware you need to order described below, flash the `zephyr/samples/basic/blink` to your nRF52833DK.

Tip

Make sure you can successfully do this, as it will test your USB cable connection, USB serial port device permissions and your build/flash environment.

Important

You will be doing all of the lessons in this Nordic Dev Academy fundamentals course and earning the online certification by the end of the semester will count towards your final grade.

Hardware to Buy

- Order a [nRF52833DK](#).
- If you want to 3D print an enclosure for your nRF52833DK, you can find a design here: [3D Printable Enclosure for nRF52833 DK](#).
- Make sure you have the appropriate USB cable to flash the device from your laptop. This may require an adaptor for some laptops.

Important

Make sure that your USB cable supports data transfer and is not just a charging cable.

Warning

We will not have USB cables and adapters available in the lab.

- Order a [MCP9808 High Accuracy I2C Temperature Sensor Breakout Board](#). (Link is to Adafruit, but you can get it from other vendors as well.)

Technical Reports: Jupyter Notebooks

Lab exercises will require data analysis to be performed in Jupyter notebooks. Please review the [Technical Report Preparation](#) page to make sure that you have all of the necessary tools to edit Jupyter notebooks and access to the necessary Python packages.

What to Submit

Complete the online Gradescope “quiz” indicating completion of each of the main tasks above.
